

YINGJIE SUN

Industrial & Product Designer

Digital products and creative systems

I design physical products, visual systems and AI-native workflows, connecting form, CMF, 3D and brand. I start with use and materials, then develop ideas through models, prototypes and comparison.

From form to system

I design physical products, visual systems and AI-native workflows, connecting form, CMF, 3D and brand. I start with use and materials, then develop ideas through models, prototypes and comparison.

Understand use and constraints, then compare form, materials, hierarchy and interaction. Models and prototypes make choices discussable. AI supports references, variations and workflows; people retain judgment and verification.

FORM / SYSTEM / INTELLIGENCE

2026.02 — Present

Hangzhou Liling Enterprise Services

Brand design & project coordination

2025.08 — 2026.01

HannStar Board

Design systems engineering designer

2025.03 — 2025.12

BENWU

3D designer

2023.12 — 2025.02

Hunan Ouyin Culture & Media

Design assistant

2021.09 — 2025.06

Changzhou Institute of Technology

Bachelor's degree in Product Design

01

Biyuan AI — Identity & Product Experience

A shared identity, clear information hierarchy and continuous task paths for a multi-model service.

My role

Visual identity, UI design & experience iteration

Stage

Public website and model directory; product integrations in iteration

The public case records overall VI/UI and iteration collaboration. Biyuan models and services are credited to their providers; the case focuses on identity, interface and iteration decisions.

Credits and context / Level B

Overall VI/UI and iteration by Yingjie Sun; completed with the project team

AI / Human: Multiple model services form the product context; human responsibility covers brand hierarchy, interface structure, interaction trade-offs and pre-release review.

Human review: Review of brand and interface hierarchy; Checks on model output and state feedback; Review of launch scope and service ownership

Read the complete case

One identity across desktop and mobile

Biyuan desktop homepage

Biyuan mobile homepage

Desktop and mobile views share naming and brand rules. The smaller screen rearranges information around the primary action.

Support browsing and deliberate search

Biyuan model directory

Filtered model search

Model lists and name search support two different tasks. Hierarchy helps users identify a model, understand its entry point and continue.

02

Resume Formatter

An open-source fork bringing a master resume, job-specific versions, factual evidence and formatting into one workspace.

My role

Collaborative work on an open-source fork

Stage

v2.4.0, public web tool

The public tool is available online. It is a collaborative extension of an MIT-licensed upstream project with attribution retained; fictional demo résumés are shown as interface content for the product study.

Credits and context / Level A

Collaborative development of a fork of gracexygu/resume-formatter; upstream and this fork use the MIT License

AI / Human: AI rewriting is optional; humans choose, review diffs, verify dates and numbers, and approve or discard changes.

Human review: Fact evidence and job-version diff review; Import, layout and PDF-output checks; Upstream attribution, license and privacy-boundary checks

Read the complete case

Make automated rewriting reviewable

Reviewing an AI rewrite diff in Resume Formatter

Before-and-after differences let the user choose which changes to keep. Confirmation and undo preserve control over the text.

Give the master and variants distinct roles

Master resume, job version and evidence workspace

The master retains stable facts; role-specific versions choose emphasis. Evidence links keep wording close to its supporting record.

Make layout changes visible and reversible

Resume Formatter template and layout controls

Templates change presentation rather than silently changing facts. This tool builds on an MIT upstream fork; this portfolio’s independent Word-export pipeline is not a feature claim about that editor.

03

Formline — Geometry Studio

A local logo editor that keeps geometric construction and optical corrections visible and independently editable.

My role

Collaborative work

Stage

Local editor with desktop and mobile interfaces

The public case records a local Logo-editor prototype and its interface structure. Geometry solving and drawing use open-source components; itemized diagnostics are not presented as general automated capability.

Credits and context / Level B

Collaborative work using PlaneGCS, Paper.js and other open-source components under their respective licenses

AI / Human: The current record does not document AI generation in geometric decisions; humans control construction rules, optical correction, comparison and export approval.

Human review: Human comparison of construction and optical correction; Review of export formats and diagnostic cues; Open-source dependency and license-boundary checks

[Read the complete case](#)

Keep spatial input and feedback together

Formline desktop geometry editor

Objects, parameters and views share one editor. Drawing, selection and constraints help users understand the next action.

Online case

Preserve the spatial task on a small screen

Formline mobile X-Ray view

Mobile reallocates attention between tools and canvas. X-Ray exposes internal relationships while retaining an explicit way back.

04

Xintiao — Native WeChat Mini Program

A lightweight tool centered on today’s earned income, connecting a salary calendar, daily records and three-step onboarding.

My role

Product, interaction, visual and WeChat adaptation participation

Stage

Native mini-program development and validation

The public case records local development and simulator verification of a native WeChat mini-program. Its wage-calculation core reuses an AGPL-3.0-only upstream; it is not an official PayDance product, and launch or real-world accuracy are unverified.

Credits and context / Level B

- Salary core reused from MrBaoboer/PayDance under AGPL-3.0-only; not an official PayDance product; presented as collaborative work
- AI / Human: The current record does not document AI in wage calculation or interaction decisions; humans control product structure, interaction, visual design and platform adaptation.
- Human review: Checks for wage rules, overnight shifts and breaks; Simulator state and theme-display review; Upstream AGPL attribution and platform-release checks

[Read the complete case](#)

Make the income model understandable

Salary configuration in Xintiao onboarding

Xintiao native home screen

A clear first-run configuration connects home-screen values to user inputs. Native WeChat developer-tool captures document this interface.

Let users inspect the number

Xintiao salary details

Xintiao calendar with no completed records

The detail view explains a result; the calendar handles days without records. Empty states are part of the workflow.

Let users control appearance and motion

Xintiao appearance and animation settings

Themes and motion controls accommodate preferences. The native mini-program reuses PayDance’s AGPL-3.0-only calculation core, credited separately from interface work.

05

Lensflow

A local AI creation workspace connecting image capture, structured analysis, prompt organisation and generation tasks.

My role

Collaborative work

Stage

Workspace, Chrome extension and product site

The public demo uses precomputed content and does not prove live model calls or broad compatibility. Open-source components are included; personal contribution is limited to the documented product, interaction and implementation collaboration.

Credits and context / Level B

Includes AI-assisted implementation and open-source components; dependency licenses retained

AI / Human: AI supports implementation and forms part of the workflow; analysis and generation in the demo are precomputed samples. Humans control input, editing, comparison, recovery and release decisions.

Human review: Human review of sources, prompts and task state; Partial-failure recovery and compatibility checks; Open-source license and release-boundary checks

Read the complete case

Establish input context before the task

Lensflow onboarding and demo workspace

Guidance and sample material provide a starting point. Material, task and result share a workspace that supports stepwise progress and recovery.

Reuse structured material analysis

Lensflow image analysis and structured results

Structured output helps analysis feed later tasks. This public demonstration uses precomputed results and does not claim live model inference.

06

AI Video Systems — From Prompt Cases to Reusable Workflows

A 22-second vertical film records how storyboard, blocking, identity continuity and camera constraints can become a reviewable AI-video workflow.

My role

Independent research and workflow design

Stage

Independent applied research

The public page presents the author-supplied final film, newly authored system diagrams and the process used to organise the work. Credits identify source inputs, editable files and third-party media separately.

Credits and context / Level B

Final film and process account supplied by Yingjie Sun; public libraries, posts and articles are reference studies credited below

AI / Human: GPT 6 / Codex assisted plot-to-storyboard scripting, prompts and scene descriptions; Blender supported blocking; Seedance 2.5 rendered the final video. AI output does not replace decisions about camera, structure, selection or release.

Human review: Human approval of plot and storyboard script; Shot-by-shot review of identity, camera, action and physical relations; Review of source, reference scope, copy and public-display permission

[Read the complete case](#)

A controllable creative workflow

Workflow map from case observation to a reviewed output

A Blender blocking frame from the supplied source video used to check camera and cast relations

A film-language reference, a new story and two character inputs become a storyboard, Blender blocking, controlled imagery and prompts, then a Seedance 2.5 render. The 11 storyboard units and 20+ characters are my process-log counts.

Review relationships, then revise the right layer

Six control layers for an AI video workflow

Review relationships, then revise the right layer

A searchable reference index, six control layers and eight analyses connect product, CMF, space and narrative. The personal 22.08–second film remains a process record; the page separates source analysis from personal workflow application. Explore Systems / AI video methods on the website.
